От Западной Европы - Италия.

Вечерница большая (*Nyctalus siculus* Palumbo) и рыжая (*Nyctalus noctula* Schreb.) одни из самых обычных мышей лесной полосы района.

Вместе с нетопырями просыпаются от зимней спячки в начале марта, когда начинает ~~сильно~~ пригревать весеннее солнце, но в холодные и пасмурные вечера не вылетает из своих убежищ.

Хороший лет этих летучих мышей по вечерам начинается с половины апреля.

В 1936 г. с 13 по 19 мая шли на Кавказе ежедневно проливные дожди, сильно похолодало, а на альпийских дугах выпало довольно много снега. Летучие мыши в эти дни совершенно прекратили лет и вновь появились только 20 мая.

Замечено, что в июне и июле лет мышей становится менее интенсивным, возобновляясь в августе.

Осенью ^{перед зимней спячкой} последние мыши замечались в начале ноября.

Кроме перечисленных видов в Заповеднике были найдены кожанок горный - *Eptesicus serotinus* Schreb. (Кавказ), кожан двухцветный - *Despertilio murinus* L. (Кавказ), ушан - *Plecotus auritus* L. (Кавказ, Бабук-Дул) и длиннокрыл - *Myotis schreibersii* Kuhl. (Красная Поляна).

Нахождение на Западном Кавказе *Pipistrellus* *savii* Bonap. и *Myotis lamachus* ^{субкавказный} раз подчеркивает пестроту и сборность фауны Кавказа и богатство ее не только представителями фауны севера, но и юга - Западно-Средиземно-морской и Персидской.

~~Виды кротов являются вредителями не только для~~
~~только кротов являются вредителями не только для~~
 ползает огромное количество насекомых и в том числе вредите-
 лей леса и полей.

Кроты НАСЕКОМОЯДНЫЕ. *Insectivora.*

Из отряда насекомоядных на территории Заповедника в настоящее время найдено 7 форм, представленных 3-мя семей-
 ствами: кроты - *Talpidae*, эти - *Eriopidae* и землеройки
Soricidae

Единственный представитель семейства *Talpidae*,
 кавказский крот (*Talpa caucasica* Satun....) отличается
 от других кротов Союза глазами лишенными век в совершенно
 невидимых слезушках, т.к. они заросли кожной пленкой.

В пределах Заповедника крот распространен всюду, до
 альпийских лугов включительно (до 2500 м.). Крот присутствие
 легко обнаружить по характерным куполообразным кучкам земли,
 выбрасываемой при рытье подземных ходов. На альпийских лугах
 можно встретить ^{выходные} ~~каменные~~ кучки земли, но несколько больших
 размеров. Эти кучки принадлежат интересному грызуну - *Проме-*
тевой мыши, ~~Она~~ отличается от кротовых кроме
 размеров кучки более крупным диаметром хода (от 10 см. и
 выше).

Крот всю жизнь проводит под землей, очень редко появ-
 ляясь на ее поверхности. Отличаясь чрезвычайной чуткостью
 к различным порохам и шумам на поверхности земли, крот при
 преследовании уходит часто не по своим ходам, а углубляясь
 прямо в почву вертикально вниз.

Весной и осенью самка приносит от 3 до 7 детенышей.

— Питается крот преимущественно земляными червями, рако и др. беспозвоночными.

— Шкурка крота отличается красивым бархатистым черным мехом и заготавливается в большом количестве.

— В районах Азово-Черноморского края, прилегающих к заповеднику, заготавливалось в некоторые годы около 30.000 шкурок кротов.

Из семейства *Euracidae*.... по периферии Заповедника редко встречаются они (*Euracus romanicus* ^{Barbet-Nam.}....) Их встречали в бассейне Белой (Хамшики, р. Березовая, ср. течение р. Кизи) и в верх ^{овьях} рек Поупсе и Илхавиха (северо-западные склоны г. Физт).

Третье семейство (*Soricidae*....) многочисленное. Бурозубка Сатункина (*Sorex araneus satunini* ^{найдена} ^{Озн.}) на Кише и Паскуне; бурозубка Радде (*Sorex raddei* ^{встречается} ^{Сат.}....) в окр. ^{оде} Красной Поляны, на хр. Кочерга и др. районах заповедника; малая бурозубка Волаухина (*Sorex minutus volauehini* ^{Озн.}....) описана с ^{Кизи}, кроме этого была поймана в Гузарипле и на ^{азиатской} ^{шпу} г. Б. Тура.

Впервые на территории Заповедника (1934 г.) были пойманы 3 куторм или водяные землеройки (*Blarina sp?*....). Встречались они на реках Белой, Мзыте и Белухе.

Наконец последний представитель этого семейства серая белозубка (*Crocodylus casia* ^{Thomas}....) была найдена в окр. ^{Красной Поляны}.

Об образе жизни землероек, этих маленьких хищников,

почти ничего неизвестно.

Питаются землеройки преимущественно насекомыми, реже
~~растительными веществами~~ нападают на шмелей,
преобладающих их размерами.
